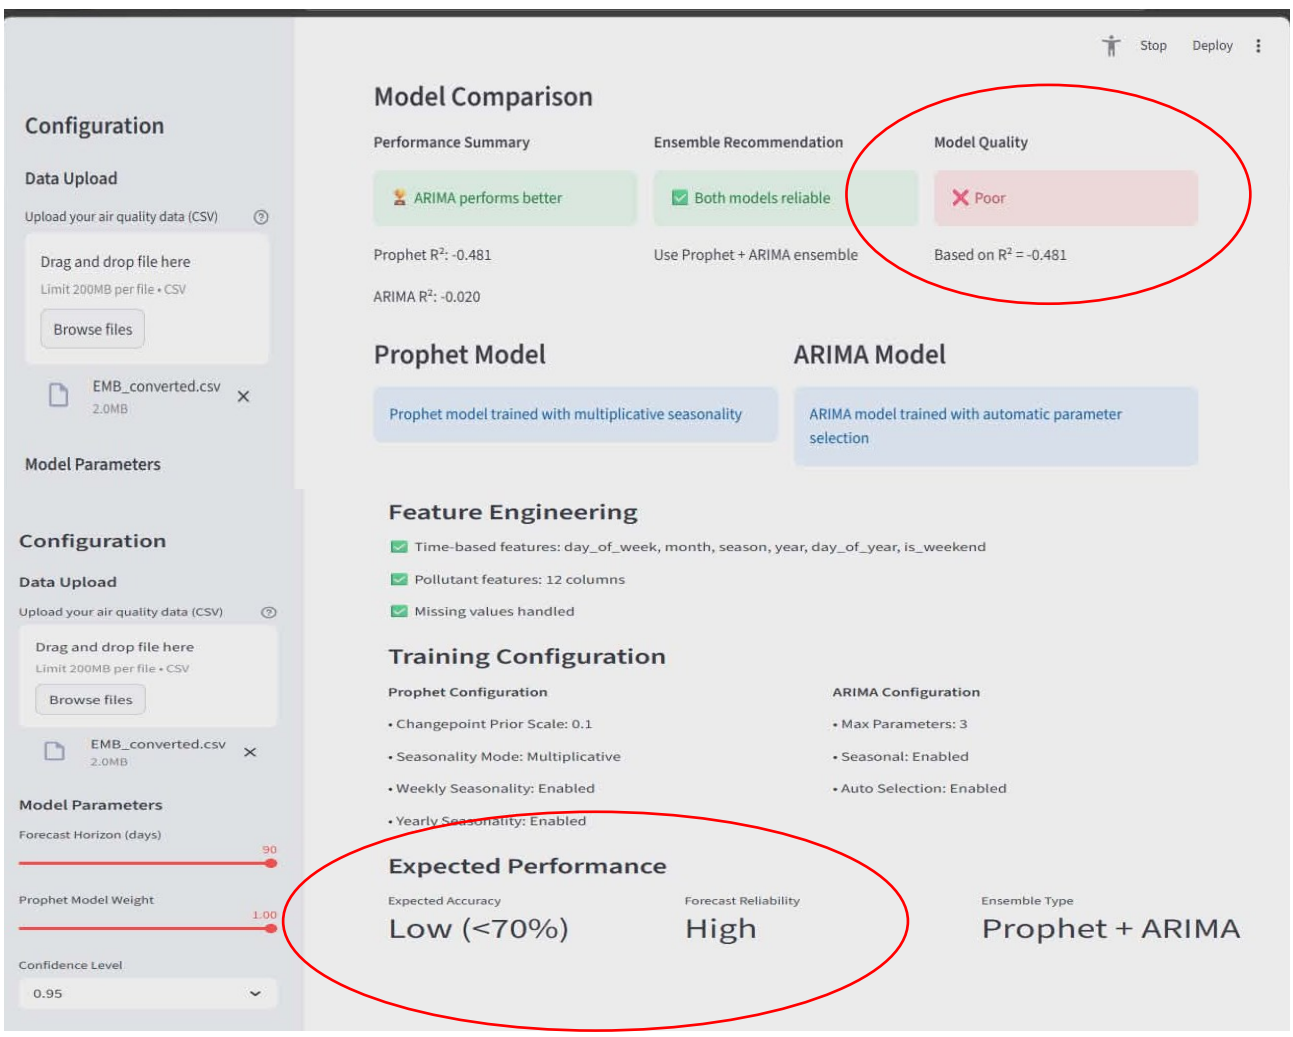
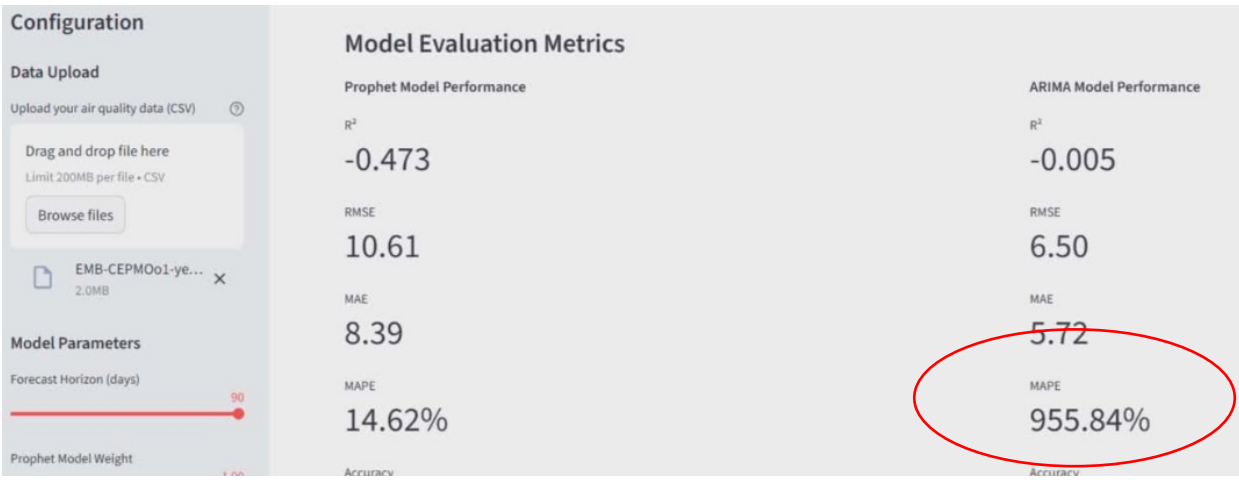
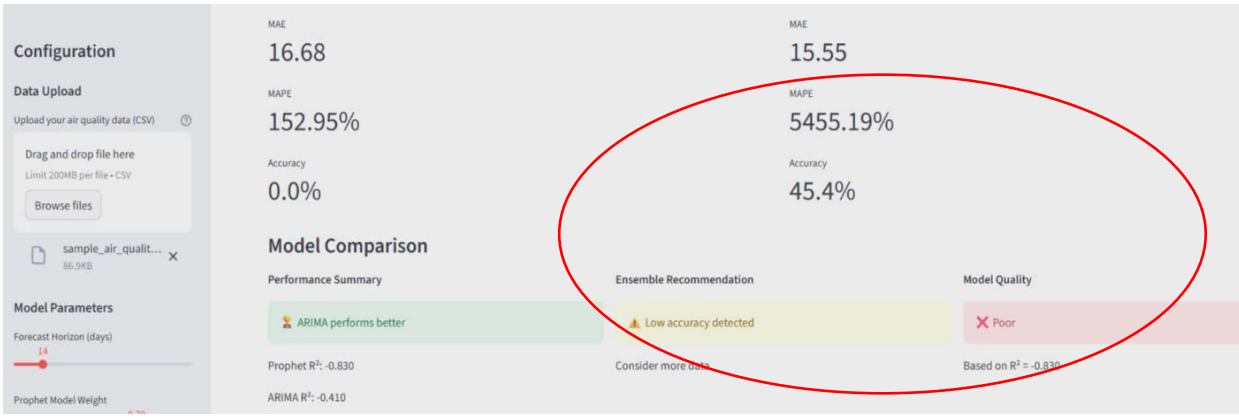
Questions from us

Questions from our panels during system checking

1. **Data training resets every time we move to another tab (Forecast, Data Process, Health analysis) is it possible for fixing?**
2. **Expected accuracy shows low (<70%) with 24000 plus data from EMB Converted and EMB-CEPMO CSV files but says both models are reliable and forecast reliability is high and it does not make sense, with that data Accuracy must be high since forecast reliability shows "HIGH"**
3. **Why is Model quality poor but has HIGH forecast reliability**







4. **MAPE should not be that high, its prediction is 900%-1000% off the actual data. The ideal MAPE percentage should not exceed 50%-100% because it will have low forecast accuracy. (We tried changing CSV files, confidence level and model weight to different values)**
